

COHORT 2 · ADVANCED B2B WORKFLOWS

Voice Integration Lab

From conversation to coordinated work.

A two-week operating system for directing permissioned B2B workflows, keeping teams in the loop, and turning data, tasks, and decisions into traction.

WEEK 15

Build the integration map. Understand the handoff from Voice to Work, approved tools, and human review.

WEEK 16

Run advanced field loops: signal, brief, practice, approval, and next action—without surrendering control.

THE STANDARD

Connect context. Constrain actions. Confirm the outcome. Keep judgment at the edge.

Weeks 13–14 gave you a voice.

Weeks 15–16 give it a system.

The next level is not asking Voice to do everything. It is knowing when a voice conversation should become a bounded task, what context the task can use, and when a human must approve the next move.

INSIDE THIS ISSUE

01	The advanced integration map	03
02	Voice, Work, apps & approvals	04
03	The Permission Ladder	05
04	Week 15 live session	06
05	Four B2B integration plays	07–08
06	Advanced loops & delegated threads	09–10
07	Approval command center	11
08	Risk commands, challenge & worksheet	12–14
09	Feature notes & sources	15

16

“Connect the right context.
Create the right constraint.
Keep the right person
accountable.”

THE INTEGRATION MINDSET

The critical distinction

General ChatGPT Voice does not currently support apps. The advanced workflow in this guide begins when eligible desktop Voice directs tasks inside Work or Codex, using only the tools and permissions available in that selected experience. [1][2][3]

Translation: You are not “turning Voice loose” on your business. You are using your voice to steer a permissioned task environment.

The advanced integration map.

When a task needs more than a conversational answer, Voice can become the control plane: it starts the work, supplies direction, checks the result, and changes course while the selected environment does the bounded execution. [1][3]

Operating truth: The value is not the number of systems you connect. The value is the number of high-leverage decisions you make faster with the right context and a clear approval point.

Voice, Work, apps, and approvals each do a different job.

Confusion creates risk. Use this simple stack to identify what is actually happening in a workflow before you delegate it.

LAYER	WHAT IT IS FOR	WHAT IT MAY USE	YOUR DISCIPLINE
Voice conversation	Natural direction, follow-up, interruption, and progress checks.	Conversation context; availability depends on Voice mode and account. [1]	Say the outcome and guardrails out loud. Do not treat it as an authorization.
Work / Codex task	Longer, multi-step work that produces a deliverable, research, analysis, or execution.	Tools and permissions of the selected desktop environment. [1][3]	Define scope, sources, review criteria, and a stop point.
Connected app / plugin	Approved search, reference, sync, or configured write-action capabilities.	Only what the app, plan, role, surface, and workspace configuration permit. [2]	Connect the minimum data and action scope required.
Approval control	Human authorization before meaningful, external, sensitive, or difficult-to-undo actions.	Permission settings and approval cards where available. [2]	Read the proposed action—not just the summary—and choose deliberately.

Voice is not a shortcut around governance.

Voice follows the same permissions as the tasks it directs. A spoken command does not grant a task access it does not already have. [1]

Apps are not one-size-fits-all.

Specific capabilities vary by the integration, plan, workspace role, configuration, and region. Teach workflows as patterns; validate actual app behavior before production use. [2]

The Permission Ladder

Build trust in the workflow by moving from low-risk context to higher-risk action only when the business case is clear and the review point is explicit.

1

READ

Retrieve or inspect the approved facts, project material, updates, or records needed to understand the situation.

2

DRAFT

Organize notes, create a brief, produce a proposed message, or prepare options without moving anything externally.

3

REVIEW

Surface assumptions, compare alternatives, identify the owner, and present an approval-ready recommendation.

4

ACT

Perform a configured action only when the task has permission and the required approval standard is met.

Default to the lowest effective rung.

For most B2B workflows, Read + Draft delivers substantial leverage without increasing execution risk. Graduating to action requires a documented reason, bounded capability, and owner awareness.

Know the available controls.

App permissions may include Always ask, Any changes, Important actions, or Never ask. The availability of settings can differ, but “Important actions” is the documented default. [2]

Language that protects the leader: “Use the permitted sources to prepare a draft. Do not send, change, upload, create, or share anything. Flag any missing information and wait for my approval.”

Teach the handoff—then make them practice it.

The learning objective is not “connect more tools.” It is “direct the right work with the right boundary.” Every learner should leave able to describe a workflow’s context, action scope, and approval point.

MINUTES	FACILITATOR MOVE	LEARNER OUTCOME
0–8	Revisit the Week 13–14 Voice Formula. Ask: “Which real workflow is still trapped in your head, inbox, or notes?”	Learners connect Voice mastery to a concrete B2B bottleneck.
8–16	Teach the integration map: Speak → Delegate → Connect → Review. Emphasize that general Voice and connected apps are not identical modes. [1][2]	Learners understand the task handoff and why permissions matter.
16–28	Use a safe demo: ask for a pre-call brief from a project’s permitted source material, with “do not send or change anything” as the guardrail.	They hear an advanced request with a clear boundary.
28–40	Show the Permission Ladder. Let the room decide which rung a scenario belongs on and where a human approval must occur.	They gain a usable governance vocabulary.
40–52	Run a paired practice: one person plays leader; one plays “risk officer.” The risk officer must tighten the task’s sources, action scope, and review language.	They rehearse the decision-making, not merely prompt wording.
52–60	Assign the Integration Challenge. Each learner selects one low-risk Read + Draft workflow for the week.	They leave with a safe, measurable real-world test.

Four permissioned moves for the field.

These plays describe outcomes, not a promise that a specific integration is enabled. Use them only where the necessary tools, sources, and controls are actually available.

01 · READ + DRAFT

Account Signal Brief

Pull permitted account context into a 90-second update before a call, while keeping assumptions and missing information visible.

“Using only the approved account sources available to this task, prepare a 90-second brief: current status, meaningful changes, open questions, and one decision I need to make. Do not send or alter anything.”

02 · DRAFT + REVIEW

Meeting-to-Momentum

Turn a spoken call debrief into an internal recap and a proposed follow-up that is ready for a human decision.

“I will debrief this meeting out loud. Create an internal summary, a client-facing follow-up draft, and a list of facts I must verify. Do not send it. Highlight any detail I did not state clearly.”

03 · READ + PRACTICE

Stakeholder Rehearsal

Use a permitted project brief to rehearse a hard stakeholder conversation without exposing information outside the workspace.

“Use the approved project context to role-play the most skeptical stakeholder. Ask one question at a time. Coach my answer for clarity and risk—do not introduce outside facts.”

04 · MONITOR + ESCALATE

Decision Watchlist

Maintain a bounded list of blocking decisions, owners, and next checks while work proceeds in threads.

“Review the active work in this project. Give me a Decision Watchlist: blocker, owner, evidence, decision needed, and recommended next check. Escalate uncertainty; do not take action.”

Turn handoffs into operating loops.

Advanced B2B work is a sequence of small handoffs. Each loop should clarify the signal, the work to be done, the person who owns the decision, and the point where the task must wait.

A

Signal → Brief

A new note, meeting outcome, customer update, or internal question enters the project. The task gathers only the authorized context and produces a decision-ready brief.

Leader asks: "What changed, what does it mean, and what needs my judgment?"

B

Brief → Practice

Convert the brief into a role-play, objection rehearsal, discovery plan, or coaching huddle before the live conversation happens.

Leader asks: "Where is the weak assumption, weak question, or weak message?"

C

Meeting → Record

Speak the debrief while it is fresh. The task creates a clear internal record and a proposed next communication—without sending it.

Leader asks: "What is certain, what is open, and who owns the next move?"

D

Record → Next Action

Translate the approved record into a focused follow-up, task, reminder, or escalation that honors the actual permissions in the environment.

Leader asks: "What can proceed now, and what requires an explicit approval?"

Integration design test: If the workflow cannot name the input, output, accountable owner, and approval point, it is not ready to be delegated.

Delegate in threads. Lead in one conversation.

In the desktop environment, Voice can create separate threads for longer tasks, check existing work, and bring back progress, blockers, and results. [1] That creates a new leadership pattern: one voice conversation coordinating several bounded workstreams.

THREAD 01

Prepare

Build the account brief, extract key questions, and identify risks from the permitted project context.

Voice command: “Start the preparation thread. Bring back only the decisions and questions I need before the call.”

THREAD 02

Practice

Role-play the hard conversation, pressure-test language, and create a short response plan.

Voice command: “Start a practice thread. Challenge our message as a skeptical CFO and return the top three gaps.”

THREAD 03

Follow Through

After the call, organize the debrief, draft the recap, and create the internal Decision Watchlist.

Voice command: “Open a follow-through thread. Do not send anything. Tell me what needs my approval.”

The 60-second leadership check-in

“What has progressed? What is blocked? What assumption could create rework? What decision do you need from me next?”

Do not mistake parallel work for unmanaged work.

One voice chat can be active at a time, and long-running work has usage and task allowances. Keep the thread list small, visible, and tied to a business outcome. [1][3]

Stay close to the decision, not chained to the screen.

The value of remote access is not constant surveillance. It is the ability to step in when work needs context, a choice, a clarification, or an approval.

START

Capture the idea

While a field insight is fresh, create a bounded task that can prepare an internal brief or working draft before the opportunity cools.

STEER

Answer the blocker

When a task reaches a decision point, give the guidance that prevents rework instead of waiting until the entire draft is wrong.

APPROVE

Make the call

Review tradeoffs, outputs, and proposed actions from the authorized environment. You still own the decision and the consequence.

What Remote can mean

OpenAI documents a mobile experience that can surface active Codex threads, approvals, plugins, project context, output, and updates from authorized connected machines. Availability remains platform- and rollout-dependent. [4]

What it does not mean

It does not remove the need for access controls, clear task scope, cautious review, or a human decision-maker. Never describe remote continuity as unrestricted access to every system or workflow.

Steering script: “Show me the decision point, the evidence, the risk of each option, and the recommendation. Do not proceed until I choose.”

Keep your hand on the edge of the workflow.

The best advanced workflow creates momentum without creating surprise. Design every B2B integration with a visible edge where the system must wait for the accountable leader.

External communication

Emails, messages, calendar invitations, comments, and public posts can carry brand, contractual, compliance, and relationship consequences. Draft quickly; review before sending. [2]

Data movement

Uploading a file, changing sharing access, moving content, or exposing sensitive information can have meaningful impact. Confirm exactly what will be shared and with whom. [2]

Irreversible change

Deleting content, cancelling something, changing permissions, creating credentials, or modifying records requires a clear owner and an appropriate approval setting. [2]

High-stakes advice

Even a well-prepared recommendation can be wrong, incomplete, or outdated. Verify current facts, policy requirements, financial details, and client-facing claims before acting.

The approval brief

When a task reaches the edge, do not ask for “approval?” Ask for a structured decision packet.

- ✓ **Proposed action:** What exactly will happen?
- ✓ **Destination:** Which system, record, person, or audience is affected?
- ✓ **Source:** What approved facts support it?
- ✓ **Risk:** What could be wrong, missing, sensitive, or hard to undo?
- ✓ **Decision:** What are the options, recommendation, and required owner choice?

Voice command: “Prepare the approval brief. Do not act. Show me the proposed change, the evidence, the risk, and the exact decision you need from me.”

The words that make integrations safer.

A strong voice leader does not only say what to do. They say what the system must not do, what evidence it may use, and when it must return for a decision.

CONSTRAIN SOURCES

“Use only...”

“Use only approved sources available to this task. Do not browse for, infer, or add external facts unless I explicitly authorize it.”

CONSTRAIN ACTION

“Do not...”

“Do not send, upload, change, delete, schedule, move, or share anything. Prepare a draft and wait for my approval.”

CONSTRAIN TRUTH

“Flag...”

“Flag uncertainty, missing data, unsupported claims, and contradictions. Separate verified facts from recommendations.”

CONSTRAIN ESCALATION

“Stop when...”

“Stop and return an approval brief when a task affects a client, an external party, sensitive data, a financial decision, or an irreversible change.”

Why the language matters

A permission setting creates technical boundaries. A clear voice instruction creates operational boundaries. You need both.

Screen context is powerful—treat it accordingly.

On macOS, an appshot may include accessible text outside the visible scroll area. Close sensitive material and inspect the frontmost window before you invite Voice to look. [1]

The 7-Day Integration Challenge

This is not a race to connect systems. It is a practice in creating well-scoped, safe, high-leverage operating loops.

DAY 1

01

Map one bottleneck from signal to decision. Name the input, output, owner, and approval edge.

DAY 2

02

Run a Read + Draft account brief with the “do not act” guardrail.

DAY 3

03

Turn a live meeting debrief into an internal record and a review-ready follow-up draft.

DAY 4

04

Practice one hard stakeholder conversation from approved project context.

DAY 5

05

Ask for a Decision Watchlist: blocker, owner, evidence, and decision needed.

DAY 6

06

Run a task in a thread, then perform the 60-second leadership check-in by voice.

DAY 7

07

Build one Approval Brief and explain exactly why the task must wait for a human choice.

Bring to the next session

The one workflow that created the most momentum—and the one guardrail that prevented the biggest possible mistake.

Score the workflow

Did it reduce time-to-clarity? Did it surface a better question? Was the permission edge visible? Did the final decision still feel fully owned by a person?

My advanced integration blueprint

Design one responsible workflow before connecting more. The strongest integrations are narrow enough to control and valuable enough to repeat.

1. The B2B bottleneck I will solve

Choose a real signal, preparation, meeting, decision, or follow-up gap.

2. The authorized context it needs

List only the source material and access scope actually required.

3. The action it may take—and may not take

State both boundaries. “Draft only” is a valid and powerful first deployment.

4. The human approval edge

What decision, risk, or external consequence requires an accountable person?

My first voice command: “Using only the permitted context for this project, help me create _____. Do not _____. Flag uncertainty and return an approval brief before any external action.”

INTEGRATION-READY

Teach the workflow. Verify the capability.

“Advanced B2B voice integrations” is a training label. It describes voice-directed, permissioned workflows; it does not mean that every account, Voice mode, app, device, or workspace has the same capability.

Key product distinction General ChatGPT Voice mode currently does not support apps. Desktop Voice inside Work or Codex can direct tasks using the tools and permissions available to that experience. [1][2][3]	What must be confirmed locally Plan eligibility, app availability, role controls, action settings, surface support, connected-source scope, data governance, and the exact approval behavior of the configured workflow. Direct the work. Design the edge. Own the decision.

Advanced voice is not an automation fantasy. It is a disciplined way to put the right context, the right constraints, and the right human judgment into motion at the right time.

Your standard: Let every integration make your team faster, clearer, and more accountable—not merely busier.
